The generalized theory of electrical machines is developed for a generalized machine having a number of coils with their axes located on the fixed d- and q-axes. Some machines may require fewer than 4 coils to represent them, while others may require more.

### Generalized Theory Of Electrical Machines

Electric machines such as electric motors, transformers, and solenoids operate based on Faraday's law, which describes the force produced by the interaction between a current-carrying conductor and a magnetic field. The materials that are used to construct the motor define its performance.

PRINCIPLES OF OPERATION OF SYNCHRONOUS MACHINES The synchronous electrical generator (also calledalternator) belongs to the family of electric rotating machines. Other members of the family are the direct- current (dc) motor or generator, the induction motor or generator, and a number of derivatives of all these three.

During the latter part of the 1800s, the study of electricity was largely considered to be a subfield of physics.It was not until the late 19th century that universities started to offer degrees in electrical engineering. In 1882, Darmstadt University of Technology founded the first chair and the first faculty of electrical engineering worldwide. In the same year, under Professor Charles Cross ...

### LECTURE 2:- CLASSIFICATION OF ELECTRICAL MACHINE [PART-1]

An electric motor is a machine which converts electrical energy into mechanical energy. 2.1 Principle of operation It is based on the principle that when a current-carrying conductor is placed in a magnetic field, it experiences a mechanical force whose direction is given by Fleming's Left-hand rule and whose magnitude is given by Force,  $F = B I$  Newton Where B is the magnetic field in weber/m2.

This flow of electrical charge is referred to as electric current. There are two types of current, direct current (DC) and alternating current (AC). DC is current that flows in one direction with a constant voltage polarity while AC is current that changes direction periodically along with its voltage polarity.

In a grinding machine, there is an electric motor which supplies the motion power to the grinding wheel with the help of a belt and pulley.. So when we start the electric motor the motor rotates at a certain rpm (150-15000 RPM, it may change according to the types of grinding machine) with the help of v-belt and cone pulley the grinding wheel also starts rotating and we perform the operation.
